crops as enhancers of nutrient use examines the various plant and soil factors that contribute to nutrient use efficiency of plants it attempts to address policies regarding low input sustainable agriculture
lisa conservation oriented cropping systems and reductions in environmental contaminants
it also presents longer term remedies to some of the inherent problems of high volume applications of expensive fertilizer nutrients
this book emphasizes plant soil interaction particularly nutritional interactions involving rhizosphere microbes and stress on the root system
stress factors include moisture and low and high ph
the book also covers the genetic and physiological response of plant to nutrients at the cellular level on a whole plant basis and when subjected to stress
this book will contribute to the development of a more cost effective and judicious nutrient usage of major crops

phosphorus is an essential nutrient that occurs in almost all foods and is important for many normal physiological functions in a typical western diet it is not harmful but does adversely affect tissues in the body when consumed in excess or deficiency this book provides a comprehensive review of various aspects of phosphorus in relation to human nutritional needs sections cover phosphorus nutrition and dietary issues health risks associated with excess phosphorus intake that exceeds requirements phosphorus intake in populations at risk regulatory challenges and policy approaches and environmental impacts of phosphates in the modern food supply this book challenges the long held ideas that high dietary phosphorus intake beyond nutritional requirements is safe and the natural supply of phosphorus critical to agricultural and human food production is endless controversy surrounds the claim that largely unrestricted use of phosphorus in all aspects of food production from farm to fork increases dietary phosphorus intake and irretrievable environmental loss both of which harm human and environmental health the book editors have joined together experts in basic medical environmental nutritional and food science to explore the validity of these claims of harm from high intakes and the unchecked use of phosphorus in the global food supply despite the essential need for adequate phosphorus over all stages of plant animal and human life the growing evidence points to a worldwide increase in dietary phosphorus intake far beyond nutrient requirements significant association with chronic disease risk even when renal function is not compromised and the increase in environmental loss with crop run off animal husbandry and unretrieved phosphorus from human waste this current evidence alludes to a depleted unsustainable natural supply of phosphorus hazardous environmental pollution of lakes and waterways and significant increases in the risk of

kidney skeletal and other serious illnesses in humans in the future if action is not taken now

this book addresses in detail multifaceted approaches to boosting nutrient use efficiency nue that are modified by plant interactions with environmental variables and combine physiological microbial biotechnological and agronomic aspects conveying an in depth understanding of the topic will spark the development of new cultivars and strains to induce nue coupled with best management practices that will immensely benefit agricultural systems safeguarding their soil water and air quality written by recognized experts in the field the book is intended to provide students scientists and policymakers with essential insights into holistic approaches to nue as well as an overview of some successful case studies in the present understanding of agriculture nue represents a question of process optimization in response to the increasing fragility of our natural resources base and threats to food grain security across the globe further improving nutrient use efficiency is a prerequisite to reducing production costs expanding crop acreage into non competitive marginal lands with low nutrient resources and preventing environmental contamination the nutrients most commonly limiting plant growth are n p k s and micronutrients like fe zn b and mo nue depends on the ability to efficiently take up the nutrient from the soil but also on transport storage mobilization usage within the plant and the environment a number of approaches can help us to understand nue as a whole one involves adopting best crop management practices that take into account root induced rhizosphere processes which play a pivotal role in controlling nutrient dynamics in the soil plant atmosphere continuum new technologies from basic tools like leaf color charts to sophisticated sensor based systems and laser land leveling can reduce the dependency on laboratory assistance and manual labor another approach concerns the development of crop plants through genetic manipulations that allow them to take up and assimilate nutrients more efficiently as well as identifying processes of plant responses to nutrient deficiency stress and exploring natural genetic variation though only recently introduced the ability of microbial inoculants to induce nue is gaining in importance as the loss immobilization release and availability of nutrients are mediated by soil microbial processes
